

ABSTRACT OF THE DISCLOSURE

A shape measurement device includes: a stage for loading
a subject for measurement; an imaging section that forms an image
of the subject for measurement; and a shifting section that
5 implements relative shifting between the imaging section and
the subject for measurement to shift the imaging section to a
position corresponding to a portion on the subject for
measurement which is to be measured, and the shifting section
implements the relative shifting by shifting the imaging section
10 without shifting the stage.
